

XOTIC LUXURY CARS

Website Development — Final Functional Requirements

Purpose: Build a premium luxury car rental, chauffeur and mobility platform for Kerala, Karnataka and Tamil Nadu, with a strong focus on lead capture, location-aware vehicle matching, garage-to-garage rate estimation and WhatsApp-based enquiry handling.

Core objective

Website → Customer requirements → Vehicle/location matching → Estimated rate → WhatsApp enquiry
→ Staff availability check → Best rate → Booking.

1. Website Positioning

- Position Xotic as a premium luxury car rental, chauffeur and mobility service—not only a wedding car company.
- Primary services: Wedding, Photoshoot, Engagement, Corporate Events, Packages, VIP Transfers, South India Tours, Leisure Travel, Outstation and Monthly Chauffeur-Driven Cars.
- Primary service area: Kerala, Karnataka and Tamil Nadu. The architecture should allow additional states to be added later.

2. Initial Service Filter

- First customer question: “What are you looking for?”
- Options: Wedding; Photoshoot; Engagement; Corporate Events; Packages; VIP Transfers; South India Tour; Leisure Travel; Outstation; Monthly Chauffeur-Driven Car.
- After selection, the website should dynamically display only the relevant fields for that service.

3. Location Selection

- Location must be a core filter and pricing input.
- Allow State → City/Location selection: Kerala, Karnataka or Tamil Nadu.
- Allow manual location entry and, where supported, “Use My Location”.
- Customer location and event/venue location must be separate fields.

4. Car Segment Filter

- Filters should include All Cars, Luxury, Premium, Sedan, SUV, Convertible, Vintage, Sports Car, Limousine, Premium MPV/Van and future categories.
- Filters must work independently or in combination with location, date, service and budget.

5. Budget Filter

- Suggested options: Under ■10,000; Under ■15,000; Under ■20,000; Under ■30,000; ■30,000+; Custom Budget.
- Budget filtering must use the estimated applicable trip rate—not merely the vehicle’s base rate.
- Location, garage distance, duration and applicable charges must be considered before showing a vehicle as a budget match.

6. Fleet / Vehicle Database

- Every individual vehicle must be a separate backend inventory unit.
- Fields: Vehicle ID, brand, model, variant, segment, photos, description, features, garage location, serviceable states/cities, base rate, included hours/km, extra km/hour rates, chauffeur availability, service eligibility, availability calendar and active/inactive status.
- Identical models in different garages must remain separate inventory units because availability and pricing can differ.

7. Location-Aware Vehicle Matching

- When a customer searches from a location, prioritize suitable available vehicles based on customer location, vehicle garage, date, service type and applicable rate.
- Example: if S-Class vehicles exist in Kochi and Trivandrum and the customer is in Kottayam, the system should evaluate the appropriate/nearest available vehicle rather than simply listing the first S-Class.

8. Wedding / Event Trip Calculator

- Collect: date, reporting time, starting/pickup location, main event location, optional second event location, additional locations, final drop location and expected duration.
- Provide "+ Add Another Location".
- Allow the customer to rearrange locations in the route order.

9. Garage-to-Garage Calculation

- Pricing distance must be calculated as: Vehicle Garage → Starting Point → Event Location(s) → Final Drop → Vehicle Garage.
- Example: Kochi garage → Kottayam pickup → Kumarakom event → Alappuzha second event → Kottayam drop → Kochi garage.
- Use a reliable mapping/distance API.
- Do not expose internal garage details unless Xotic chooses to show them.

10. Pricing Engine

- Support base rental rate, included hours/km, extra km, extra hours, chauffeur charges, multi-day rates, outstation rates, parking/toll/permit charges where applicable, peak-season rates, packages and custom rates.
- Pricing rules must be editable through the admin panel.
- Do not hard-code pricing rules into the frontend.

11. Estimated Rate vs Final Rate

- Website may display an estimated rate after calculation.
- Clearly state: "This is an estimated rate. Final pricing and vehicle availability will be confirmed by the Xotic team."
- The website must not automatically confirm a booking based solely on the estimate.

12. Service-Specific Enquiry Forms

- Wedding: date, pickup, event locations, drop, reporting time, duration, segment and budget.
- Photoshoot: date, locations, duration, car/segment and budget.
- Engagement: date, locations, duration, car/segment and budget.
- Corporate: company/event, date, location, vehicle count, duration, segment and VIP requirements.
- VIP Transfer: guest/VIP, pickup, destination, date/time, flight details, vehicle and passengers.

- South India Tour: start, dates, destinations, passengers, vehicle and chauffeur requirement.
- Leisure Travel: itinerary, dates, passengers and vehicle preference.
- Outstation: start, destination, dates, duration, vehicle and passengers.
- Monthly Chauffeur: start date, city, vehicle, days/month, approximate usage, chauffeur and contract duration.
- Corporate and complex multi-day requirements should support “Request Custom Quote” instead of forced instant pricing.

13. WhatsApp Enquiry Generation

- Final CTA should be “Send Enquiry on WhatsApp”.
- Automatically generate a structured WhatsApp message containing all customer inputs, selected service, route, vehicle preference, estimated rate and Lead ID.
- The customer should explicitly tap Send; the website should not silently send a message.

14. Lead ID & Lead Management

- Generate a unique Lead ID for every enquiry, e.g. XWC-260821-001.
- Suggested prefixes: WED, CORP, AIR, TOUR, OUT, etc.
- Track status: New, Contacted, Quote Sent, Follow-up Required, Confirmed, Lost and Cancelled.

15. Staff Dashboard

- Central dashboard for all enquiries.
- Show customer details, service, date, locations, vehicle requirements, estimated rate, assigned staff, follow-up date, notes, final quote and booking status.
- Allow assignment of each lead to a specific staff member.

16. Follow-Up System

- Create reminders for leads requiring follow-up.
- Show overdue/uncontacted enquiries prominently.
- This is a key requirement because the current business problem is enquiries being delayed or lost on WhatsApp.

17. Vehicle Availability

- Admin must be able to mark vehicles Available, Booked, Temporarily Unavailable, Maintenance or Hold.
- Availability must be date/time based.
- Booked vehicles must not appear as available for overlapping requests.

18. Admin / Fleet Management

- Admin can add/edit/remove vehicles, change garage, update rates, upload photos, change categories, update serviceable cities, manage availability and update packages without developer assistance.

19. Packages

- Dedicated Packages section for Wedding, Corporate, Airport, Multi-Day Chauffeur, South India Tour and VIP packages.
- Packages and rates should be configurable from the backend.

20. Individual Vehicle Pages

- Each major vehicle should have a dedicated SEO-friendly page with photos, description, features, segment, applicable services, gallery and Check Availability CTA.

21. Gallery

- Gallery categories: Weddings, Bride & Groom, Photoshoots, Corporate Events, VIP Transfers, Luxury Cars, Chauffeur Services and Tours.

22. Mobile-First UX

- Fast mobile-first design because many enquiries will originate from Instagram and WhatsApp.
- Large touch-friendly buttons, minimal typing, easy date/location selection and persistent WhatsApp/Get Quote CTAs.
- Recommended mobile sticky actions: Call | WhatsApp | Get Quote.

23. WhatsApp & Contextual CTAs

- Floating WhatsApp button across the site.
- Contextual prefilled WhatsApp messages from vehicle, wedding, corporate, airport and other service pages.

24. SEO

- SEO must be built from the beginning.
- Use proper H1/H2 structure, metadata, clean URLs, image ALT text, sitemap, robots.txt, schema markup and Search Console integration.
- Create service/location landing pages for relevant combinations across Kerala, Karnataka and Tamil Nadu.

25. Analytics & Tracking

- Integrate Google Analytics, Google Search Console, Meta Pixel and conversion tracking.
- Track WhatsApp clicks, calls, enquiry submissions, lead source and booking conversion where technically possible.
- Measure the journey: Instagram/Ads → Website → Enquiry → WhatsApp → Booking.

26. Recommended Website Structure

Section	Purpose
HOME	Premium positioning, fleet highlights, services and primary Get a Quote CTA.
SERVICES	Wedding, Photoshoot, Engagement, Corporate, Packages, VIP, Tours, Leisure, Outstation, Monthly Chauffeur.
FIND YOUR CAR	Service → Location → Date → Segment → Budget → Route → Estimate.
OUR FLEET	Searchable/filterable vehicle inventory.
PACKAGES	Configurable service packages.
WEDDINGS	Dedicated wedding landing page and wedding fleet.
CORPORATE	Corporate and event transportation.
CHAUFFEUR SERVICES	Full-day, multi-day and monthly chauffeur services.
AIRPORT TRANSFERS	Airport pickup/drop services.
TOURS & OUTSTATION	South India travel and outstation services.
GALLERY	Visual portfolio.
ABOUT XOTIC	Company and service information.
CONTACT	Call, WhatsApp and enquiry options.

27. End-to-End Customer Journey

- 1 Customer visits Xotic website.
- 2 Selects service type.
- 3 Selects state/city or enters location.
- 4 Selects date/time.
- 5 Enters trip/event itinerary.
- 6 Selects car segment and/or budget.
- 7 System checks relevant inventory and garage-to-garage estimate.
- 8 Customer receives estimated rate.
- 9 Customer clicks Send Enquiry on WhatsApp.
- 10 Lead ID and complete enquiry reach the Xotic team.
- 11 Staff checks actual availability, vehicle location, schedule and final pricing.
- 12 Staff shares available cars and best rate.
- 13 Customer confirms.
- 14 Booking is completed.

28. Non-Negotiable Development Principles

- Build as a dynamic platform, not a static catalogue.

- Fleet, garages, availability and pricing must be backend controlled.
- Garage-to-garage calculation must be part of the core pricing logic.
- Customer location and event location must remain separate data points.
- Final booking confirmation must remain with Xotic staff.
- Every enquiry must be captured with a unique Lead ID.
- WhatsApp should be the primary immediate handoff channel, while the admin dashboard remains the source of truth for lead tracking.
- The architecture should be scalable to additional states, cities, vehicles, services and future CRM/WhatsApp Business API integrations.

Developer Note

The most important business objective is to reduce lost/delayed WhatsApp enquiries. The website should capture complete customer requirements before handing the lead to staff, calculate a useful estimate, generate a structured WhatsApp enquiry and provide a dashboard for follow-up and conversion tracking.
